LOGO PLACEHOLDER

TOPIC · METHOD · RESULT

TL;DR State the problem, your central idea, and the most important result in two or three sentences. A reader should understand the contribution from this strip alone.

1 Motivation

Describe the problem and why it matters. Keep paragraphs short enough to scan from a distance.

> **Research question.** What precise gap does this work address?

- Give the reader the minimum necessary context.
- Emphasize the limitation of existing approaches.
- End with the question your method answers.

2 Problem formulation

Use display mathematics only for equations that carry the argument.

$$\hat{\mathbf{y}} = f_\theta(\mathbf{x}), \qquad \theta^\star = \arg\min_\theta \; \mathbb{E}_{(\mathbf{x},\mathbf{y})\sim p}\big[\ell(f_\theta(\mathbf{x}), \mathbf{y})\big].$$

Assumptions

Define notation near its first use and explicitly state the setting under which the result holds.

Main statement

Place one memorable theorem, claim, or design principle here.

3 Study design

Data — Describe inputs → **Method** — Describe procedure → **Measure** — Define outcome

Figure 1. *Use diagrams to communicate structure faster than prose.*

4 Contributions

01 One new idea or formulation

02 One empirical or theoretical finding

03 One reusable artifact or implication

5 Reproducibility

✓ Data or generation procedure
✓ Configurations and random seeds
✓ Evaluation scripts and raw summaries
✓ Compute and dependency details

Link to durable artifacts or a reproducibility appendix.

6 Method

Give the method a single visual center. The reader should see inputs, transformations, and outputs immediately.

Input $\mathbf{x}$ → YOUR METHOD $f_\theta(\mathbf{x})$ One-line description → Output $\hat{\mathbf{y}}$

Design choices

- **Choice A.** Explain what it enables.
- **Choice B.** Explain the relevant tradeoff.
- **Choice C.** Explain how it is evaluated.

7 Main result

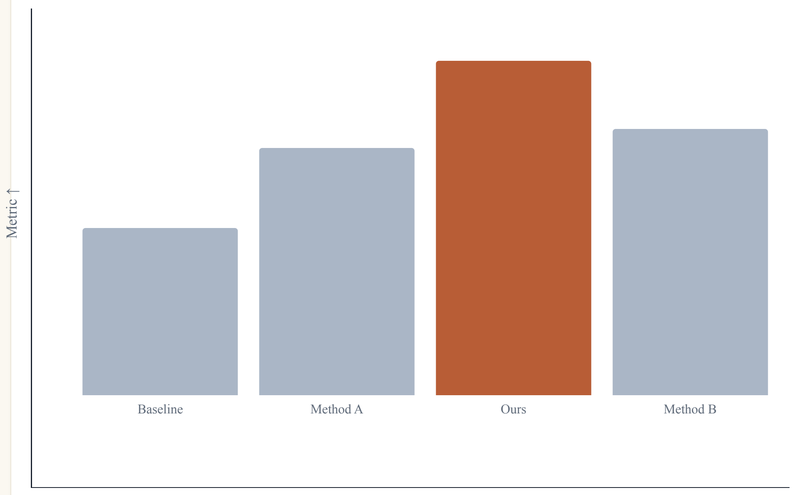

Figure 2. *Replace this placeholder with an SVG, PNG, or PDF-derived image. Explain the conclusion, not every visual detail.*

+12% Summarize the primary improvement with one defensible number.

8 Quantitative comparison

Approach	Metric A ↑	Metric B ↓
Baseline	0.72	1.40
Method A	0.79	1.18
Proposed method	**0.84**	**0.96**

Table 1. *Example values are placeholders; replace them with verified results.*

9 Ablation study

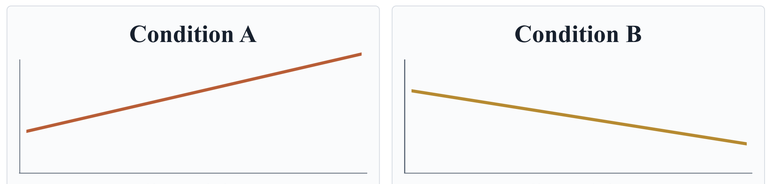

Figure 3. *Use ablations to connect design choices to observed behavior.*

10 Qualitative example

BEFORE Show a representative baseline output or failure. → **AFTER** Show how the proposed method changes it.

11 Analysis

Use this column for interpretation, diagnostics, ablations, or a second result.

- Explain what changes across conditions.
- Connect the evidence back to the research question.
- Separate observation from speculation.

12 Failure modes

A **Where it fails.** Name a concrete condition and show an example.

B **Why it fails.** Separate evidence from a plausible explanation.

C **What mitigates it.** State the practical response.

13 Limitations & scope

A strong poster states where the result applies and what remains unresolved.

Supported — List the setting directly covered by the evidence.

Future work — List the next important validation or extension.

14 Next steps

Now — Validate the central claim → **Next** — Test the boundary condition → **Later** — Study deployment at scale

★ Takeaways

1. Restate the problem in one short sentence.
2. State the core methodological contribution.
3. Give the strongest supported result.
4. Tell the reader what to remember or do next.
